COUNTABLE SETS

IMPLICATION EQUIVALENCES

Implication definition - If A, then B – Not A or B

Implication over conjunction - If A and B, then C - If A, then if B, then C

Contraposition - If A, then B – If not B, then not A

Chapter 1

Structures and Languages

1.1 Languages

1.1.1 (Definition) First-order Alphabet

- The first-order alphabet (\mathcal{L}) is a tuple of collections of symbols that consists:
- Connectives: \vee , \neg
- Quantifier: \forall

– Variables:
$$Var = \left\{ v_i \atop i \in \mathbb{N} \right\}$$

- Equality: \equiv
- Constants Const

- Functions:
$$Func = \left\{ \underbrace{f : Arity(f) = i}_{i \in \mathbb{N}} \right\}$$
- Relations: $Rel = \left\{ \underbrace{P : Arity(P) = i} \right\}$

 $- FOS \cdot \lor \neg \forall =$

1.2 Terms and Formulas

1.2.1 (Definition) Term

- The term t of the language \mathcal{L} ($t \in Term(\mathcal{L})$) iff t is a non-empty finite string and it satisfies exactly one of the following:
- $-t :\equiv v \text{ and } v \in Var$
- $-t :\equiv c \text{ and } c \in Const$

$$-t :\equiv f \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1}$$
 and $\left\{ \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1} \right\} \subseteq Term(\mathcal{L})^*$ and $f \in Func$

- Terms encode the objects or nouns in the language

- terms encode the objects or nouns in the language

1.2.2 (Definition) Formula

- The formula ϕ of the language \mathcal{L} ($\phi \in Form(\mathcal{L})$) iff ϕ is a non-empty finite string and it satisfies exactly one of the following:
- $-\phi :\equiv \equiv rs \text{ and } \{r,s\} \subseteq Term(\mathcal{L})$

$$-\phi :\equiv R \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1} \text{ and } \left\{ \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1} \right\} \subseteq Term(\mathcal{L}) \text{ and } R \in Pred$$

- $-\phi :\equiv \neg \alpha \text{ and } \alpha \in Form(\mathcal{L})^*$
- $-\phi :\equiv \vee \alpha \beta$ and $\{\alpha, \beta\} \subseteq Form(\mathcal{L})^*$
- $-\phi :\equiv \forall v\alpha \text{ and } \alpha \in Form(\mathcal{L})^* \text{ and } v \in Var$
- Formulas encode the statements or assertions in the language
- Non-recursive definitions are called atomic formulas $(\phi \in AF(\mathcal{L}))$

1.2.3 (Definition) Scope

- The the scope of the quantifier $scope(\phi, \alpha) :\equiv \alpha$ if $\phi :\equiv \forall v\alpha$
- The symbols in α lies within the scope of \forall

Induction and Recursion 1.3

1.3.1(Definition) Definition by recursion

- The set S is the (recursively defined) closure of the set J under the set of rules Q(Cl(S,J,Q)) iff S is the smallest set that satisfies all of the following:
- $-J\subseteq S$
- For any $R \in Q$, for any $\left\langle \begin{array}{c} ArityR(R)-1 \\ \hline s_i \\ \hline i=1 \end{array} \right\rangle$, $s \geqslant R$, if $\left\{ \begin{array}{c} ArityR(R)-1 \\ \hline s_i \\ \hline i=1 \end{array} \right\} \subseteq S$, then $s \in S$ In recusive definitions, the ' $x \in X$ iff P(x)' qualifier is logically equivalent to the ' $X \subseteq \{y: P(y)\}$ ' qualifier because
- For any z, P(z) iff $z \notin X$ as well
- Therefore X has to be the smallest set that satisfies P

1.3.2(Metatheorem) Proof by induction on structure

- If $J \subseteq \{x : P(x)\}$ and for any $R \in Q$, for any $\left\langle \begin{array}{c} ArityR(R)-1 \\ \hline Si \\ \hline \end{array}, s \right\rangle \in R$, (if $\left\{ \begin{array}{c} ArityR(R)-1 \\ \hline Si \\ \hline \end{array} \right\} \subseteq \{x : P(x)\}$, then $s \in \{x : P(x)\}$), then $S_{J,Q} \subseteq \{x : P(x)\}$
- Proof: $S_{J,Q} \subseteq \{x: P(x)\}$ from (definition of $S_{J,Q}$: satisfies the qualifier of smallest set)

1.3.3(Metatheorem) Proof by induction on complexity

- If $J \subseteq \{x: P(x)\}$ and (if $stage(J,Q,n) \subseteq \{x: P(x)\}$, then $stage(J,Q,n+1) \subseteq \{x: P(x)\}$), then $S_{J,Q} \subseteq \{x: P(x)\}$

(Definition) Initial segment 1.3.4

- The string s is an initial segment of the string t (IS(s,t)) iff there exists the string $u \not\equiv \epsilon, t \equiv su$

1.3.5 (Metatheorem) Initial segments of terms

- For any $s \in Term(\mathcal{L})$, for any $t \in Term(\mathcal{L})$, IS(s,t)
- Proof:
- $-\operatorname{Term}(\mathcal{L})_J \subseteq \left\{s \in \operatorname{Term}(\mathcal{L})_J : (ext{ for any } t \in \operatorname{Term}(\mathcal{L})), \, \left(\widetilde{IS(s,t)}\right)
 ight\}$
- If $s :\equiv x \in Var \cup Const$, then
- If $t :\equiv z \in Var \cup Const$, then IS(s,t) from
- $\overline{-}$ If $\overline{IS(s,t)}$, then
- $-t :\equiv su$
- $---x :\equiv zu$

```
-r := z
  -- u :\equiv \epsilon
   ---u \not\equiv \epsilon
       - CONTRADICTION — If t :\equiv f \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1}, then \widetilde{IS(s,t)} from
    — If IS(s,t), then
         f \quad t_i : \equiv xu
    - f : \equiv x
       -f \not\equiv x
     - \text{CONTRADICTION} - Term(\mathcal{L})_Q \text{ closed in } \left\{ s \in Term(\mathcal{L})_J : (\text{ for any } t \in Term(\mathcal{L})), \left( \widetilde{IS(s,t)} \right) \right\}
-\operatorname{If} s :\equiv f \begin{bmatrix} t_i \\ t_i \end{bmatrix} \text{ and } f \in Func \text{ and } \begin{Bmatrix} Arity(f) \\ t_i \end{bmatrix} \subseteq Term(\mathcal{L}) \text{ and }

1.3.6 (Metatheorem) Unique readability of terms

- For any $t \in Term(\mathcal{L})$, it satisfies exactly one of the following:
- $-t :\equiv v \in Var$ and v is unique
- $-t :\equiv c \in Const$ and c is unique

$$-t:\equiv f\underbrace{\begin{bmatrix} Arity(f)\\ t_i \end{bmatrix}}_{i=1} \text{ and } f\in Func \text{ is unique and for any } i\in \begin{Bmatrix} Arity(f)\\ \boxed{i}\\ i=1 \end{Bmatrix}, \ t_i\in Term(\mathcal{L}) \text{ is unique and for any } i\in \begin{Bmatrix} Arity(f)\\ \boxed{i}\\ i=1 \end{Bmatrix}$$

- If $t \in Var$, then variables are unique, then t is unique
- If $t \in Const$, then constants are unique, then t is unique

$$-\operatorname{If} t :\equiv f \begin{bmatrix} t_i \\ t_i \end{bmatrix}, \text{ then } \\ \frac{i=1}{Arity(f')}, \text{ then } \\ -\operatorname{If} t :\equiv f' \begin{bmatrix} t_i' \\ t_i' \end{bmatrix}, \text{ then } \\ --f :\equiv f' \\ --f \begin{bmatrix} t_i \\ t_i \end{bmatrix} :\equiv f \begin{bmatrix} t_i' \\ t_i' \end{bmatrix}$$

$$--f\begin{bmatrix} t_i \\ t_i \end{bmatrix} :\equiv f \begin{bmatrix} t_i' \\ t_i' \end{bmatrix}$$

$$Arity(f) \qquad Arity(f)$$

- If Arity(f) = 1 and $t_1 \not\equiv t'_1$, then $IS(t_1, t'_1)$ or $IS(t'_1, t_1)$, then CONTRADICTION
- If Arity(f) > 1 and for any $i \in \left\{\begin{bmatrix} i \\ i \end{bmatrix}\right\}$, $t_i :\equiv t_i'$ and $t_n \not\models t_n'$, then $IS(t_n, t_n')$ or $IS(t_n', t_n)$, then CONTRADICTION

$$--- \text{ For any } i \in \begin{Bmatrix} Arity(f) \\ \boxed{i} \\ \underline{i=1} \end{Bmatrix}, \ t_i :\equiv t_i'$$

1.3.7 (Metatheorem) Initial segments of formulas

- BACKLOG:

1.3.8 (Metatheorem) Unique readability of formulas

- BACKLOG:

1.3.9 (Definition) Language of Number theory

- $\mathcal{L}_{NT} = \{0, S, +, \bullet, E, <\}$ where:
- 0 is a constant symbol to be interpreted as 0
- -S is a 1-arity function symbol to be interpreted as increment by 1
- + is a 2-arity function symbol to be interpreted as addition
- $-\Delta$ is a 2-arity function symbol to be interpreted as multiplication
- -E is a 2-arity function symbol to be interpreted as exponentiation
- -< is a 2-arity relation symbol to be interpreted as less than

1.4 Sentences

1.4.1 (Definition) Free variable in a formula

- The variable v is free in the formula ϕ (free (v,ϕ)) iff it satisfies some of the following:
- $-\phi \in AF(\mathcal{L})$ and $occurs(v,\phi)$
- $-\phi :\equiv \neg \alpha \text{ and } free(v,\alpha)$
- $-\phi :\equiv \alpha \vee \beta$ and $free(v,\alpha)$ or $free(v,\beta)$
- $-\phi :\equiv \forall w\alpha \text{ and } v \not\equiv w \text{ and } free(v,\alpha)$

1.5. STRUCTURES

1.4.2(Definition) Sentence

- The $\phi \in Form(\mathcal{L})$ is a sentence $(\phi \in Sent(\mathcal{L}))$ iff $\{x \in Var : free(x,\phi)\} = \emptyset$

(Definition) Bound variable in a formula 1.4.3

- The variable v is bound in the formula ϕ (bound(v, ϕ)) iff occurs(v, phi) and $free(v, \phi)$

Structures 1.5

1.5.1(Definition) Structure

- The \mathcal{L} -structure \mathfrak{A} of the language \mathcal{L} ($Struct(\mathfrak{A}, \mathcal{L})$) is the tuple of:

- Universe: non-empty set A

- ConstI: for any $c \in Const, c^{\mathfrak{A}} \in A$

- FuncI: for any $f \in Func, f^{\mathfrak{A}}: \underline{A^{Arity(f)}} \to A$

- RelI: for any $P \in Rel$, $P^{\mathfrak{A}} \subset A^{Arity(P)}$

1.5.2 (Definition) Henkin structure

- The \mathcal{L} -structure $\mathfrak A$ is a Henkin structure iff it satisfies all of the following:

$$-A = \left\{ t \in Term(\mathcal{L}) : (\text{ for any } x \in Var), \left(\widetilde{occurs(x, t)}\right) \right\}$$

- For any $c \in Const$, $c^{\mathfrak{A}} = c$

- For any
$$f \in Func$$
, for any $\begin{Bmatrix} Arity(f) \\ \boxed{a_i} \\ i=1 \end{Bmatrix} \subseteq A$, $f^{\mathfrak{A}}(\underbrace{\begin{bmatrix} a_i \\ \boxed{a_i} \end{bmatrix}}_{i=1}) = f \underbrace{\begin{bmatrix} a_i \\ \boxed{a_i} \end{bmatrix}}_{i=1}$

- For any $P \in Rel$, BACKLOG: not important

- The Henkin structure uses the syntactic elements as objects of the universe - useful for the Completeness theorem

1.5.3 (Definition) Isomorphic structures

- The \mathcal{L} -structure \mathfrak{A} is isomorphic to the \mathcal{L} -structure \mathfrak{B} ($\mathfrak{A} \cong \mathfrak{B}$) iff there exists a function $i: A \to B$ and Bij(i) and it satisfies all of the following:

- For any $c \in Const$, $i(c^{\mathfrak{A}}) = c^{\mathfrak{B}}$

- For any
$$f \in Func$$
, for any $\begin{Bmatrix} Arity(f) \\ \boxed{a_i \\ i=1} \end{Bmatrix} \subseteq A$, $i(f^{\mathfrak{A}}(\underbrace{\begin{bmatrix} Arity(f) \\ \boxed{a_i} \\ i=1 \end{bmatrix}}) = f^{\mathfrak{B}}(\underbrace{\begin{bmatrix} i(a_i) \\ i(a_i) \end{bmatrix}})$
- For any $P \in Rel$, for any $\begin{Bmatrix} Arity(P) \\ \boxed{a_i \\ i=1 \end{Bmatrix}} \subseteq A$, $\underbrace{\begin{bmatrix} Arity(P) \\ \boxed{a_i} \\ i=1 \end{Bmatrix}}_{i=1} \in P^{\mathfrak{A}}$ iff $\underbrace{\begin{bmatrix} i(a_i) \\ \boxed{i(a_i)} \end{bmatrix}}_{i=1} \in P^{\mathfrak{B}}$

- For any
$$P \in Rel$$
, for any $\begin{Bmatrix} Arity(P) \\ \boxed{a_i} \\ i=1 \end{Bmatrix} \subseteq A$, $\boxed{a_i} \\ i=1 \end{Bmatrix} \in P^{\mathfrak{A}}$ iff $\boxed{i(a_i)} \\ i=1 \end{Bmatrix} \in P^{\mathfrak{A}}$

- i preserves structure by way of operations in A have corresponding equivalent operations in B

1.5.4 (Definition) Equivalence relation

- The relation R on the set S is an EqRel(R, S) iff it satisfies all of the following:
- For any $a \in S$, aRa
- For any $\{a, b\} \subseteq S$, if aRb, then bRa
- For any $\{a,b,c\}\subseteq S$, if aRb and bRc, then aRc

(Metatheorem) Isomorphic structure equivalence 1.5.5

```
- EqRel(\cong, \{\mathfrak{X}: Struct(\mathfrak{X}, \mathcal{L}\}))
```

- Proof:
- For any \mathcal{L} -structure \mathfrak{A} , then
- $-j: A \to A$ and for any $a \in A$, j(a) = a
- BACKLOG: j satisfies $\mathfrak{A} \cong \mathfrak{B}$
- For any \mathcal{L} -structures $\{\mathfrak{A},\mathfrak{B}\}$, then
- If $\mathfrak{A} \cong \mathfrak{B}$, then
- There exists $i_{A,B}$, $i_{A,B}$ satisfies $\mathfrak{A} \cong \mathfrak{B}$
- —- BACKLOG: $i_{A,B}^{-1}$ satisfies $\mathfrak{B} \cong \mathfrak{A}$ For any \mathcal{L} -structure $\{\mathfrak{A}, \mathfrak{B}, \mathfrak{C}\}$, then
- If $\mathfrak{A} \cong \mathfrak{B}$ and $\mathfrak{B} \cong \mathfrak{C}$, then
- There exists $i_{A,B}$, $i_{A,B}$ satisfies $\mathfrak{A} \cong \mathfrak{B}$
- There exists $i_{B,C}$, $i_{B,C}$ satisfies $\mathfrak{B} \cong \mathfrak{C}$
- BACKLOG: $iB, C \circ i_{A,B}$ satisfies $\mathfrak{A} \cong \mathfrak{C}$

Truth in a Structure 1.6

(Definition) Variable-universe assignment function 1.6.1

- The function s is a variable-universe assignment function into the \mathcal{L} -structure \mathfrak{A} iff $s: Var \to A$

1.6.2(Definition) Term-universe assignment function

- The function \bar{s} is the function generated from the variable-universe assignment function s iff $\bar{s}: Term(\mathcal{L}) \to A$ and it satisfies all of the following:
- If $t :\equiv x \in Var$, then $\overline{s}(t) = \overline{s}(x) = s(x)$
- If $t :\equiv c \in Const$, then $\overline{s}(t) = \overline{s}(c) = c^{\mathfrak{A}}$

$$-\text{ If } t :\equiv f \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1}, \text{ then } \overline{s}(t) = \overline{s}(f \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1}) = f^{\mathfrak{A}}(\underbrace{\begin{bmatrix} \overline{s}(t_i) \\ \overline{s}(t_i) \end{bmatrix}}_{i=1})$$

(Definition) Modification of variable-universe assignment function 1.6.3

- The function s[x|a] is an x-modification of the variable-universe assignment function s iff $x \in Var$ and $a \in A$ and it satisfies all of the following:
- If $v \not\equiv x$, then s[x|a](v) = s(v)
- If $v :\equiv x$, then s[x|a](v) = s[x|a](x) = a
- The mapping of x is fixed to a

1.6.4(Definition) Relative truth to assignment

- The \mathcal{L} -structure \mathfrak{A} satisfies the formula ϕ with the variable-universe assignment function s ($\mathfrak{A} \models \phi[s]$) iff it satisfies all of the following:
- If $\phi : \equiv \equiv rt$, then $\overline{s}(r) = \overline{s}(t)$

$$-\operatorname{If} \phi :\equiv P \underbrace{\begin{bmatrix} t_i \\ t_i \end{bmatrix}}_{i=1}, \operatorname{then} \left\langle \underbrace{\begin{bmatrix} \overline{s}(t_i) \\ \overline{s}(t_i) \end{bmatrix}}_{i=1} \right\rangle \in P^{\mathfrak{A}}$$

- If $\phi :\equiv \neg \alpha$, then $\mathfrak{A} \not\models \alpha[s]$
- If $\phi := \vee \alpha \beta$, then $\mathfrak{A} \models \alpha[s]$ or $\mathfrak{A} \models \beta[s]$
- If $\phi := \forall x \alpha$, then for any $a \in A$, $\mathfrak{A} \models \alpha[s[x|a]]$
- The \mathcal{L} -structure \mathfrak{A} satisfies the set of formulas Γ with the variable-universe assignment function s ($\mathfrak{A} \models \Gamma[s]$) if for any $\gamma \in \Gamma, \mathfrak{A} \models \gamma[s]$

1.6.5 (Metatheorem) Variable assignment determines term assignment

```
- If s_1 and s_2 are variable-universe assignment functions into the \mathcal{L}-structure \mathfrak{A} and for any t \in Term(\mathcal{L}), for any
v \in \{x \in Var : occurs(x,t)\}, s_1(v) = s_2(v), \text{ then } \overline{s_1}(t) = \overline{s_2}(t)
- Proof:
-Term(\mathcal{L})_J \subseteq \{t \in Term(\mathcal{L}) : \text{ if } ((\text{ for any } v \in \{x \in Var : occurs(x,t)\}), (s_1(v) = s_2(v))), \text{ then } (\overline{s_1}(t) = \overline{s_2}(t))\}
  - If ( for any v \in \{x \in Var : occurs(x,t)\}), (s_1(v) = s_2(v)), then —- If t :\equiv v \in Var, then
      \overline{s_1}(v) = \overline{s_2}(v)
      \overline{s_1}(t) = \overline{s_2}(t)
   - If t :\equiv c \in Const, then
      c^{\mathfrak{A}} = c^{\mathfrak{A}}
   -\overline{s_1}(c) = \overline{s_2}(c)
   -\overline{s_1}(t) = \overline{s_2}(t)
-Term(\mathcal{L})_{\mathcal{O}} closed in \{t \in Term(\mathcal{L}): \text{ if } ((\text{ for any } v \in \{x \in Var: occurs(x,t)\}), (s_1(v) = s_2(v))), \text{ then } (\overline{s_1}(t) = \overline{s_2}(t))\}
                  Arity(f)
                     |t_i|
                                                                                \subseteq Term(\mathcal{L}) and
                              and f \in Func and
— If t :\equiv f
— for any t_i \in
                                             if (( for any v \in \{x \in Var : occurs(x, t_i)\}\), (s_1(v) = s_2(v))), then (\overline{s_1}(t_i) = \overline{s_2}(t_i)), then

1.6.7 (Metatheorem) Sentences have fixed truth

- If $\sigma \in Sent(\mathcal{L})$ and $\mathfrak A$ is an $\mathcal L$ -structure, then for any variable-universe assignment functions $s, \mathfrak A \models \sigma[s]$ or for any variable-universe assignment functions $s', \mathfrak A \not\models \sigma[s']$
- Proof:
- $-\{x \in Var : free(x,\sigma)\} = \emptyset$
- For any variable-universe assignment functions s_1 and s_2 , $\mathfrak{A} \models \sigma[s_1]$ iff $\mathfrak{A} \models \sigma[s_2]$

For any variable-universe assignment functions s_1 and s_2 , \mathbf{x}_1 , $\sigma[s_1]$ in \mathbf{x}_1 , $\sigma[s_2]$

1.6.8 (Definition) Structure models formula

- The \mathcal{L} -structure \mathfrak{A} models $\phi \in Form(\mathcal{L})$ ($\mathfrak{A} \models \phi$) iff for any variable-universe assignment function s, $\mathfrak{A} \models \phi[s]$
- The \mathcal{L} -structure \mathfrak{A} models $\Phi \subseteq Form(\mathcal{L})$ ($\mathfrak{A} \models \Phi$) iff for any $\phi \in \Phi$, $\mathfrak{A} \models \phi$

1.6.9 (Definition) Abbreviations

```
- BACKLOG: \land, \Longrightarrow, \Longleftrightarrow, \exists x Q(x), (\forall P(x))Q(x), (\exists P(x))Q(x)
```

1.6.10 (Metatheorem) Semantics of abbreviations

1.7 Logical Implication

1.7. LOGICAL IMPLICATION

11

1.7.1 (Definition) Logical implication

- The set of formulas Δ logically implies the set of formulas Γ ($\Delta \models \Gamma$) iff for any \mathcal{L} -structure \mathfrak{A} , if $\mathfrak{A} \models \Delta$, then $\mathfrak{A} \models \Gamma$
- $\Delta \vDash \gamma$ abbreviates $\Delta \vDash \{\gamma\}$

1.7.2 (Definition) Valid formula

- The formula ϕ is valid $(\models \phi)$ iff $\emptyset \models \phi$

1.7.3 (Metatheorem) Variables self-equiv are valid

- For any $v \in Var$, then $\models \equiv vv$
- For any structure \mathfrak{A} , for any variable-universe assignment funtion s,
- $-s(v) = \overline{s}(v)$
- $-\overline{s}(v) = \overline{s}(v)$
- $-\mathfrak{A} \models (\equiv vv)[s]$

1.7.4 (Definition) Universal closure

- The universal closure of $\phi \in Form(\mathcal{L})$ with the free variables $v_i = v_i$ satisfies $v_i = v_i$ satisfies $v_i = v_i$ and $v_i = v_i$ of $v_i = v_i$ satisfies $v_i = v_i$
- The universal closures of $\Phi \subseteq Form(\mathcal{L})$ satisfies $UC(\Phi) = \{UC(\phi) : \phi \in \Phi\}$

1.7.5 (Metatheorem) Universal closure preserves validity

- For any $\phi \in Form(\mathcal{L})$, for any $x \in Var$, for any structure \mathfrak{A} , $\mathfrak{A} \models \phi$ iff $\mathfrak{A} \models \forall x \phi$
- If $\mathfrak{A} \models \phi$, then
- For any variable-universe assignment function $s, \mathfrak{A} \models \phi[s]$
- For any $a \in A$, $\mathfrak{A} \models \phi[s[x|a]]$
- $--\mathfrak{A} \vDash \forall x \phi$
- If $\vDash \forall x \phi$, then
- For any variable-universe assignment function $s, \mathfrak{A} \models (\forall x \phi)[s]$
- For any $a \in A$, $\mathfrak{A} \models \phi[s[x|a]]$
- $--\mathfrak{A} \models \phi[s[x|s(x)]]$
- $-\mathfrak{A} \models \phi[s]$

1.7.6 (Metatheorem) Logical equivalence

- ϕ has a logical equivalence to ψ iff $\models (\phi \implies \psi)$ and $\models (\phi \implies \psi)$
- ϕ has a weak logical equivalence to ψ iff $\phi \models \psi$ and $\psi \models \phi$

1.7.7 (Metatheorem) Strong logical equivalence property

```
- If \vDash (\phi \implies \psi), then \phi \vDash \psi
```

- Proof:
- $\text{ If } \models (\phi \implies \psi), \text{ then }$
- For any structure \mathfrak{A} ,
- For any variable-universe assignment function s,
- $\underline{\hspace{0.5cm}} \mathfrak{A} \vDash (\phi \implies \psi)[s]$
- If $\mathfrak{A} \models \phi[s]$, then $\mathfrak{A} \models \psi[s]$
- —- If (for any variable-universe assignment function $s_1, \mathfrak{A} \models \phi[s_1]$), then
- For any variable-universe assignment function s_2 ,
- $---\overline{\mathfrak{A}} \vDash \overline{\phi[s_2]}$
- ¡HYP¿ —— If $\mathfrak{A} \models \phi[s_2]$, then $\mathfrak{A} \models \psi[s_2]$
- $---\mathfrak{A} \models \psi[s_2]$

```
— For any variable-universe assignment function s_2, \mathfrak{A} \models \psi[s_2] — If \mathfrak{A} \models \phi, then \mathfrak{A} \models \psi — \phi \models \psi
```

1.7.8 (Metatheorem) Weak logical equivalence property

```
- Not (If \phi \models \psi, then \models (\phi \implies \psi))
- Equivalently, \phi \vDash \psi and \not\vDash (\phi \implies \psi)
- Proof by counter-example:
- Let \phi :\equiv (x < y) and \psi :\equiv (z < w)
– For any structure \mathfrak{A},
- If \mathfrak{A} \models (x < y), then
— For any variable-universe assignment function s_1, \mathfrak{A} \models (x < y)[s_1]
-- <^{\mathfrak{A}} = A \times A
  - For any variable-universe assignment function s_2, \mathfrak{A} \models (z < w)[s_2]
-- \mathfrak{A} \models (z < w)
-(x < y) \vDash (z < w)
- Let \mathfrak{N} = \langle \mathbb{N}, <_{std} \rangle
-\mathfrak{N} \not\models (x < y) \implies (z < w)[s[x|0][y|1][w|0][z|1]]
-\mathfrak{N} \not\models (x < y) \implies (z < w)
- \not \vdash (x < y) \implies (z < w)
- \not\vdash \phi \implies \psi
```

1.8 Substitutions and Substitutability

1.8.1 (Definition) Substitution in a term

- The term $|u|_t^x$ is the term u with the variable x replaced by the term t iff it satisfies some of the following:
- If $u :\equiv y \in Var$ and $y \neq x$, then $|u|_t^x :\equiv |y|_t^x :\equiv y$
- If $u :\equiv x$, then $|u|_t^x :\equiv |x|_t^x :\equiv t$
- If $u :\equiv c \in Const$, then $|u|_t^x :\equiv |c|_t^x :\equiv c$
- $-\text{ If } u :\equiv f \underbrace{\begin{bmatrix} Arity(f) \\ u_i \end{bmatrix}}_{i=1}, \text{ then } |u|_t^x :\equiv \left| f \underbrace{\begin{bmatrix} u_i \\ u_i \end{bmatrix}}_{i=1}^x \right|_t^x :\equiv f \underbrace{\begin{bmatrix} |u_i|_t^x \\ |u_i|_t^x \end{bmatrix}}_{i=1}$

1.8.2 (Definition) Substitution in a formula

- The formula $|\phi|_t^x$ is the formula ϕ with the variable x replaced by the term t iff it satisfies some of the following:
- If ϕ is atomic
- If $\phi :\equiv \equiv u_1 u_2$, then $|\phi|_t^x :\equiv |\equiv u_1 u_2|_t^x :\equiv \equiv |u_1|_t^x |u_2|_t^x$

$$--\text{ If }\phi \coloneqq P \underbrace{\begin{bmatrix} u_i \\ i=1 \end{bmatrix}}^{Arity(P)}, \text{ then } |\phi|_t^x \coloneqq \left| P \underbrace{\begin{bmatrix} u_i \\ u_i \end{bmatrix}}_{i=1} \right|_t^x \coloneqq P \underbrace{\begin{bmatrix} |u_i|_t^x \\ |u_i|_t^x \end{bmatrix}}_{i=1}$$

- If ϕ is not atomic
- If $\phi :\equiv \neg \alpha$, then $|\phi|_t^x :\equiv |\neg \alpha|_t^x :\equiv \neg |\alpha|_t^x$
- $\overline{}$ If $\phi :\equiv \forall \alpha \beta$, then $|\phi|_t^x :\equiv |\forall \alpha \beta|_t^x :\equiv \forall |\alpha|_t^x |\beta|_t^x$
- If $\phi :\equiv \forall y \alpha$, then
- If $y :\equiv x$, then $|\phi|_{t}^{x} :\equiv |\forall y \alpha|_{t}^{x} :\equiv \forall y \alpha$
- \longrightarrow If $y \not\equiv x$, then $|\phi|_t^x :\equiv |\forall y \alpha|_t^x :\equiv \forall y |\alpha|_t^x$

1.8.3 (Definition) Substitutable term

- The term t is substitutable for the variable x in the formula ϕ (Subbable(t, x, ϕ)) iff it satisfies some of the following:
- $-\phi$ is atomic
- $-\phi :\equiv \neg \alpha \text{ and } Subbable(t, x\alpha)$

```
\begin{array}{l} -\phi :\equiv \forall \alpha\beta \text{ and } Subbable(t,x\alpha) \text{ and } Subbable(t,x\beta) \\ -\phi :\equiv \forall y\alpha \text{ and it satisfies some of the following:} \\ -\underbrace{free(x,\phi)}_{-occurs(y,t) \text{ and } Subbable(t,x\alpha)} \end{array}
```

- Identifies if the substitution preserves the context of the variables; i.e., bound variables stay bound, free variables stay free
- Some operations will not be permitted even though substitution is always defined

1.8.4 (Metatheorem) Closed terms are subbable

```
- If the term t is closed, then Subbable(t, x, \phi)
- If \phi atomic, done
- If \phi :\equiv \neg \alpha and if t is closed, then Subbable(t, x, \alpha)
- If t is closed, then
-- Subbable(t, x, \alpha)
 -Subbable(t, x, \phi)
- If \phi := \forall \alpha \beta and if t is closed, then Subbable(t, x, \alpha) and if t is closed, then Subbable(t, x, \beta)
- If t is closed, then
  -Subbable(t, x, \alpha)
-Subbable(t, x, \beta)
-Subbable(t, x, \phi)
- If \phi := \forall y \alpha, and if t is closed, then Subbable(t, x, \alpha)
- If t is closed, then
-- Subbable(t, x, \alpha)
 -occurs(y,t)
    Subbable(t, x, \phi)
```

1.8.5 (Metatheorem) Variables are self-subabble

```
- Subbable(x, x, \phi)

- If \phi atomic, done

- If \phi :\equiv \neg \alpha and Subbable(x, x, \alpha), then Subbable(x, x, \phi)

- If \phi :\equiv \lor \alpha \beta and Subbable(x, x, \alpha) and Subbable(x, x, \beta), then Subbable(x, x, \phi)

- If \phi :\equiv \forall y \alpha and Subbable(x, x, \alpha), then Subbable(x, x, \phi)

- If y :\equiv x, then \widehat{free}(x, \phi), Subbable(x, x, \phi)

- If y :\not\equiv x, then \widehat{occurs}(y, t), then Subbable(x, x, \phi)
```

1.8.6 (Metatheorem) Substitutions of non-free variables is the identity

```
- If free(x,\phi), then |\phi|_t^x := \phi
- If \phi is atomic, then
— If free(x,\phi), occurs(x,\phi), then sub is identity (BACKLOG: not proven)
- If \phi is not atomic, then
— If \phi := \neg \alpha and if free(x,\alpha), then |\alpha|_t^x := \alpha, then
— If free(x,\phi), then
— free(x,\alpha)
— |\alpha|_t^x := \alpha
— |\phi|_t^x := |\neg \alpha|_t^x := \neg |\alpha|_t^x := \neg \alpha := \phi
— If \phi := \forall \alpha \beta, BACKLOG: do
— If \phi := \forall y \alpha, BACKLOG: do
```

1.8.7 (Metatheorem) Subbable is decidable

Chapter 2

Deductions

2.1 Deductions

2.1.1 (Definition) Meta-restrictions for deduction

- Λ is the set of formulas that are logical axioms
- Σ is the set of formulas that are non-logical axioms
- R_I is the set of relations that are rules of inferences
- In order to do this, we will impose the following restrictions on our logical axioms and rules of inference:
- 1. (Logical) axioms are decidable
- 2. Rules of inference are decidable
- 3. Rules of inference have finite inputs
- 4. (Logical) axiom are valid
- 5. Our rules of inference will preserve truth. For any $\langle \Gamma, \phi \rangle \in R_I$, $\Gamma \vDash \phi$
- (1-3) States that each step must be checkable and computable in finite time
- (4-5) States that each step is valid

(4-5) States that each step is valid

2.1.2 (Definition) Deduction

- The finite sequence $\left\langle \begin{array}{c} n \\ \hline \phi_i \end{array} \right\rangle$ is a deduction from the non-logical axioms Σ $(\Sigma \vdash \left\langle \begin{array}{c} n \\ \hline \phi_i \end{array} \right\rangle)$ iff $n \in \mathbb{N}$ and for any $1 \leq i \leq n$, it satisfies some of the following:
- $-\phi_i \in \Lambda$
- $-\phi_i \in \Sigma$
- There exists $R \in R_I$, $\langle \Gamma, \phi_i \rangle \in R$ and $\Gamma \subseteq \left\{ \begin{bmatrix} i-1 \\ \phi_j \\ j=1 \end{bmatrix} \right\}$
- $\Sigma \vdash \phi_n$ abbreviates $\Sigma \vdash \left\langle \begin{bmatrix} n \\ \hline \phi_i \end{bmatrix} \right\rangle$

2.1.3 (Metatheorem) Top-down definition equivalence of deduction

- $Thm_{\Sigma} = \{ \phi \in Form(\mathcal{L}) : \Sigma \vdash \phi \} = Cl(\Lambda \cup \Sigma, R_I)$
- Proof:
- $-Cl(\Lambda \cup \Sigma, R_I) \subseteq Thm_{\Sigma}$
- If $\phi \in \Lambda \cup \Sigma$ then
- $--- \Sigma \vdash \langle \phi \rangle$
- $--\Sigma \vdash \phi$
- $--- \phi \in Thm_{\Sigma}$

```
— If there exists R \in R_I, \langle \Gamma, \phi \rangle \in R and \Gamma \subseteq Thm_{\Sigma}, then
-- \Sigma \vdash \langle \Gamma \rangle
 -- \Sigma \vdash \langle \Gamma, \phi \rangle
    -\Sigma \vdash \phi
   -- \phi \in Thm_{\Sigma}
-Thm_{\Sigma} \subseteq Cl(\Lambda \cup \Sigma, R_I)
   - If \phi_i \in Thm_{\Sigma}, then
  - If i=1, then
     -\Sigma \vdash \overline{\langle \phi_i \rangle}
 --- \phi_i \in \Lambda \cup \Sigma
 --- \phi_i \in Cl(\Lambda \cup \Sigma, R_I)
-- If i > 1 and \begin{Bmatrix} i-1 \\ \phi_j \\ j=1 \end{Bmatrix} \subseteq Cl(\Lambda \cup \Sigma, R_I), then --- If \phi_i \in \Lambda \cup \Sigma, then \phi_i \in Cl(\Lambda \cup \Sigma, R_I)
If there exists R \in R_I, \langle \Gamma, \phi_i \rangle \in R and \Gamma \subseteq \left\{ \begin{bmatrix} i-1 \\ \phi_j \end{bmatrix} \right\}
           \Gamma \subseteq Cl(\Lambda \cup \Sigma, R_I)
             \phi_i \in Cl(\Lambda \cup \Sigma, R_I)
```

Logical Axioms

- Λ is the collection of all logical axioms

2.2.1 (Definition) Equality axioms

- E1: For any $v \in Var$, $\equiv vv \in \Lambda$

- E2: For any
$$f \in Func$$
, $((\land \underbrace{ = x_i y_i}_{i=1}) \implies (f(\underbrace{x_i}_{i=1})) \stackrel{Arity(f)}{=} f(\underbrace{y_i}_{i=1}))) \in \Lambda$
- E3: For any $P \in Rel \cup \{ \equiv \}$, $((\land \underbrace{ = x_i y_i}_{i=1}) \implies (P(\underbrace{x_i}_{i=1})) \stackrel{Arity(P)}{=} P(\underbrace{y_i}_{i=1})$

- E3: For any
$$P \in Rel \cup \{\equiv\}$$
, $((\bigwedge_{i=1}^{Arity(P)} \Longrightarrow (P(\underbrace{x_i}_{i=1})) \Longrightarrow P(\underbrace{y_i}_{i=1}))) \in \Lambda$

- E2 and E3 allows equal parameters to be swapped

2.2.2(Definition) Quantifier axioms

- Q1: For any $Subbable(t, x, \phi)$, $((\forall x \phi) \implies |\phi|_t^x) \in \Lambda$
- Q2: For any $Subbable(t, x, \phi), (|\phi|_t^x \implies (\exists x \phi)) \in \Lambda$
- Q1 and Q2 use the Subbable qualifier to preserve the nature of the variables

2.2.3 (Metatheorem) Logical axioms are decidable

- BACKLOG: (Equality axioms are decidable + Quantifier axioms are decidable) = Λ are decidable

Rules of Inference 2.3

(Definition) Propositional formula 2.3.1

- The propositional formula ϕ of the language \mathcal{L} ($\phi \in Prop(\mathcal{L})$) iff $\phi \in Form(\mathcal{L})$ and it satisfies some of the following:
- $-\phi \in AF(\mathcal{L})$
- $-\phi :\equiv \forall x\alpha$

2.3. RULES OF INFERENCE

17

```
-\phi :\equiv \neg \alpha \text{ and } \alpha \in Prop(\mathcal{L})^*
-\phi :\equiv \vee \alpha \beta and \{\alpha, \beta\} \subseteq Prop(\mathcal{L})^*
```

- Non-recursive definitions are called propositional variables $(\phi \in PV(\mathcal{L}))$

2.3.2(Definition) Truth assignment

- The variable-truth assignment v is the function $v: Prop(\mathcal{L})_J \to \{\bot, \top\}$
- The formula-truth assignment \overline{v} of the variable-truth assignment v is the function $\overline{v}: Prop(\mathcal{L}) \to \{\bot, \top\}$ and it satisfies some of the following:
- $-\phi \in Prop(\mathcal{L})_J \text{ and } \overline{v}(\phi) = v(\phi)$
- $-\phi \in Prop \text{ and } \phi : \equiv \neg \alpha \text{ and }$
- If $\overline{v}(\alpha) = \bot$, then $\overline{v}(\phi) = \top$
- If $\overline{v}(\alpha) = \top$, then $\overline{v}(\phi) = \bot$
- $-\phi \in Prop \text{ and } \phi : \equiv \vee \alpha \beta \text{ and }$
- If $\overline{v}(\alpha) = \bot$ and $\overline{v}(\beta) = \bot$, then $\overline{v}(\phi) = \bot$
- If $\overline{v}(\alpha) = \bot$ and $\overline{v}(\beta) = \top$, then $\overline{v}(\phi) = \top$
- If $\overline{v}(\alpha) = \top$ and $\overline{v}(\beta) = \bot$, then $\overline{v}(\phi) = \top$
- $\text{ If } \overline{v}(\alpha) = \top \text{ and } \overline{v}(\beta) = \top, \text{ then } \overline{v}(\phi) = \top$
- The set of formulas Φ is true for the variable-truth assignment v ($\overline{v}^*(\Phi) = \top$) iff for any $\phi \in \Phi$, $\overline{v}(\phi) = \top$

2.3.3(Metatheorem) Formulas are propositional

- $Form(\mathcal{L}) = Prop(\mathcal{L})$
- Proof:
- $-Prop(\mathcal{L}) \subseteq Form(\mathcal{L})$ from definition
- $-Form(\mathcal{L}) \subseteq \overline{Prop(\mathcal{L})}$
- If $\phi \in AF(\mathcal{L})$, then $\phi \in Prop(\mathcal{L})$
- If $\phi \not\in AF(\mathcal{L})$, then
- —- If $\phi :\equiv \forall x \alpha$ and $\alpha \in Prop(\mathcal{L})$, then $\phi \in Prop(\mathcal{L})$
- If $\phi :\equiv \neg \alpha$ and $\alpha \in Prop(\mathcal{L})$, then $\phi \in Prop(\mathcal{L})$
- If $\phi :\equiv \vee \alpha \beta$ and $\{\alpha, \beta\} \subseteq Prop(\mathcal{L})$

2.3.4 (Definition) Propositional consequence

- The formula ϕ is a propositional consequence of the set of formulas Γ ($\Gamma \vDash_{PC} \phi$) iff for any variable-truth assignment v, if $\overline{v}^*(\Gamma) = \top$, then $\overline{v}(\phi) = \top$
- The formula ϕ is a tautology iff $\emptyset \vDash_{PC} \phi$
- $\models_{PC} \phi$ abbreviates $\emptyset \models_{PC} \phi$

2.3.5(Metatheorem) Deduction theorem for PL

$$-\left\{ \begin{bmatrix} \gamma_i \\ \gamma_i \end{bmatrix} \right\} \vDash_{PC} \phi \text{ iff } \vDash_{PC} (\land \underbrace{\gamma_i}_{i=1}) \implies \phi$$

- If $\gamma_1 \vDash_{PC} \phi$, then
- —- For any variable-truth assignment v,
- If $\overline{v}(\gamma_1) = \top$, then $\overline{v}(\phi) = \top$

- $-- \models_{PC} \gamma_1 \implies \phi$
- If $\models_{PC} \gamma_1 \implies \phi$, then
- For any variable-truth assignment v,
- If $\overline{v}(\gamma_1) = \top$, then $\overline{v}(\phi) = \top$
- $--- \gamma_1 \vDash_{PC} \phi$
- $-\gamma_1 \vDash_{PC} \phi \text{ iff } \vDash \gamma_1 \implies \phi$

$$- \text{ If } n > 1 \text{ and } \begin{Bmatrix} \frac{n-1}{\gamma_i} \\ \frac{1}{i-1} \end{Bmatrix} \vDash_{PC} \phi \text{ iff } \vDash_{PC} (\bigwedge_{i=1}^{n-1}) \implies \phi, \text{ then }$$

$$- \begin{Bmatrix} \frac{n-1}{\gamma_i} \\ \frac{1}{\gamma_i} \end{Bmatrix} \cup \gamma_n \text{ ... ditto basis step arguments}$$

Proof: TODO: from truth tables and definitions

(Definition) PC rules of inference 2.3.6

- PC: If $\Gamma \vDash_{PC} \phi$, then $\langle \Gamma, \phi \rangle \in R_I$
- This allows tautologies to be immediately useable in deductions

(Definition) QR rules of inference 2.3.7

```
- QR1: If free(x, \psi), then \langle \{\psi \implies \phi\}, \psi \implies (\forall x \phi) \rangle \in R_I
```

- QR2: If $free(x, \psi)$, then $\langle \{\phi \implies \psi\}, (\exists x\phi) \implies \psi \rangle \in R_I$
- The qualifier $free(x, \psi)$ is used to denote that there are no assumptions about x in ψ

(Metatheorem) Rules of inferences are decidable 2.3.8

- BACKLOG: (PC rules are decidable + QR axioms are decidable) = Λ are decidable

2.3.9 (Metatheorem) Tautologies and models have similar shapes

```
- For any \mathcal{L}-structure \mathfrak{A}, for any variable-universe assignment function s, for any \phi \in Form(\mathcal{L}), if for any p \in \{p \in PV(\mathcal{L}) : occurs(p,\phi)\}
 v(p_i) = \top iff \mathfrak{A} \models p_i[s], then \overline{v}(\phi) = \top iff \mathfrak{A} \models \phi[s]
 - If \phi \in PV(\mathcal{L}), then \overline{v}(\phi) = v(\phi) = \top iff \mathfrak{A} \models \phi[s]

2.6 Properties of Our Deductive System

2.6.1 (Metatheorem) equiv is an equivalence relation

```
- For any \{x, y, z\} \in Var,
- \vdash x \equiv x
-\vdash x \equiv y \implies y \equiv x
-\vdash (x \equiv y \land y \equiv z) \implies x \equiv z
- Proof:
- \vdash x \equiv x
_{i}E1_{i}. -\vdash x \equiv y \implies y \equiv x
--((x \equiv y) \land (x \equiv x)) \implies ((x \equiv x) \implies (y \equiv x))
\mathrm{iE}3 \vcentcolon - x \equiv x
\mathsf{E}1\mathsf{i} - (x \equiv y) \implies ((x \equiv x) \implies (y \equiv x))
iPC_{i} - (x \equiv y) \implies y \equiv x
PC_{i} - \vdash (x \equiv y \land y \equiv z) \implies (x \equiv z)
\overline{-(x \equiv x \land y \equiv z)} \implies ((x \equiv y) \implies (x \equiv z))
_{i}E3i - x \equiv x
\mathsf{jE1} \vcentcolon - (y \equiv z) \implies ((x \equiv y) \implies (x \equiv z))
PC_{i} - (y \equiv z \land x \equiv y) \implies (x \equiv z)
PC_{i} - (x \equiv y \land y \equiv z) \implies (x \equiv z)
iPC; ========
```

2.6.2 (Metatheorem) Universal closure preserves deductibility

```
\begin{array}{l} -\Sigma \vdash \phi \text{ iff } \Sigma \vdash \forall x \phi \\ -\text{ If } \Sigma \vdash \phi \text{, then} \\ -\Sigma \vdash \phi \\ -\Sigma \vdash \phi \\ -\Sigma \vdash ((\forall z(z \equiv z)) \lor \neg(\forall z(z \equiv z))) \implies \phi \\ \text{iPC}; -\Sigma \vdash ((\forall z(z \equiv z)) \lor \neg(\forall z(z \equiv z))) \implies \forall x \phi \\ \text{iQR1}; -\Sigma \vdash ((\forall z(z \equiv z)) \lor \neg(\forall z(z \equiv z))) \\ \text{iPC}; -\Sigma \vdash \forall x \phi \\ \text{iPC}; -\text{ If } \Sigma \vdash \forall x \phi, \text{ then} \\ -\Sigma \vdash \forall x \phi \implies |\phi|_x^x \\ \text{iQ1}; -\Sigma \vdash |\phi|_x^x \\ \text{iPC}; -\Sigma \vdash \phi \\ -((\forall z(z \equiv z)) \lor \neg(\forall z(z \equiv z))) \text{ is a closed formula that is tautological} \end{array}
```

- $\ {\rm Keep \ structures} + {\rm variable\text{-}universe} \ {\rm assignment \ functions} \ {\rm in \ mind \ when \ interpreting \ universal \ closure \ deductions}$
- We can replace axioms with all sentences without changing the strength of the deductive system

2.6.3 (Metatheorem) Universal closure preserves strength of axioms

```
\begin{array}{l} -\Sigma \vdash \phi \text{ iff } UC(\Sigma) \vdash \phi \\ -\text{ Proof:} \\ -\text{ If } \Sigma \vdash \phi \text{, then } -- UC(\Sigma) \vdash \Sigma \\ -- UC(\Sigma) \vdash \phi \\ -\text{ If } UC(\Sigma) \vdash \phi \text{, then } \\ -- \Sigma \vdash UC(\Sigma) \\ -- \Sigma \vdash \phi \end{array}
```

- We can universally close the set of formulas Σ and it will deduce the same as $UC(\Sigma)$ sentences

2.6.4 (Metatheorem) Deduction theorem

```
- If \theta is a sentence, then \Sigma \cup \{\theta\} \vdash \phi iff \Sigma \vdash \theta \implies \phi

- If \Sigma \cup \{\theta\} \vdash \phi, then \Sigma \vdash \theta \implies \phi
```

2.6.5 (Metatheorem) Proof by contradiction

```
\begin{split} &-\operatorname{If} \ \Sigma \vdash \phi, \ \text{then} \\ &-\Sigma \cup \{\neg \phi\} \vdash \phi \\ &-\Sigma \cup \{\neg \phi\} \vdash \neg \phi \\ &-\Sigma \cup \{\neg \phi\} \vdash ((\forall z(z\equiv z)) \land \neg (\forall z(z\equiv z))) \\ &\operatorname{;PC} \vdots -\operatorname{If} \ \Sigma \cup \{\neg \phi\} \vdash ((\forall z(z\equiv z)) \land \neg (\forall z(z\equiv z))), \ \text{then} \\ &-\Sigma \vdash \neg \phi \implies ((\forall z(z\equiv z)) \land \neg (\forall z(z\equiv z))) \end{split}
```

2.6.6 (Metatheorem) Strong to weak quantification

2.6.7 (Metatheorem) Quantifier switcheroni

2.6.8 (Metatheorem) Quantifier combineroni

2.7 Non-logical Axioms

- The non-logical axioms characterizes the behavior of a specific theory
- Non-logical axioms have to be decidable as well

2.7.1 (Definition) Weak number theory

2.7.2 (Metatheorem) Weak number theory theorems

```
- For any natural numbers a,b,

- If a=b, then N\vdash \hat{a}\equiv \hat{b}

- If a\neq b, then N\vdash \neg(\hat{a}\equiv \hat{b})

- If a< b, then N\vdash \hat{a}<\hat{b}

- BACKLOG: ... - BACKLOG: Proof:
```

2.7.3 (Metatheorem) Weakness of weak number theory 1

- $-N \not\vdash \neg (x < x)$
- BACKLOG: p.298 Construct a structure $\mathfrak A$ that satisfies $\mathfrak A \models N$ and $\mathfrak A \not\models \forall x \neg (x < x)$

2.7.4 (Metatheorem) Weakness of weak number theory 2

- $-N \not\vdash (x+y) \equiv (y+x)$
- BACKLOG: p.298 Construct a structure $\mathfrak A$ that satisfies $\mathfrak A \models N$ and $\mathfrak A \not\models (x+y) \equiv (y+x)$

Chapter 3

Completeness and Compactness

Naively 3.1

3.1.1 (Definition) Completeness

- If $\Sigma \vDash \phi$, then $\Sigma \vdash \phi$

3.2 Completeness

27

3.2.1(Definition) Contradictory sentence

```
- The sentence \stackrel{\smile}{\perp} :\equiv ((\forall z(z \equiv z)) \land \neg (\forall z(z \equiv z)))
```

- For any language \mathcal{L} , $\perp \in Sent(\mathcal{L})$

3.2.2(Definition) Inconsistent and unsatisfiable

- The set of formulas Σ is inconsistent iff $\Sigma \vdash \overline{\bot}$
- The set of formulas Σ is consistent iff $\Sigma \not\vdash \bot$
- The set of formulas Σ is unsatisfiable iff $\Sigma \models \overline{\bot}$
- The set of formulas Σ is satisfiable iff $\Sigma \not\models$

3.2.3(Metatheorem) Contradiction has no model

```
- a ≠ ±
- Proof:
 - \text{ If } \mathfrak{A} \models \overline{\perp}, \text{ then }
 -\mathfrak{A} \models (\forall z(z \equiv z)) \text{ and } \mathfrak{A} \models \neg(\forall z(z \equiv z))
¡Definition; — \mathfrak{A} \not\models (\forall z(z \equiv z)) ¡Definition; — Not \mathfrak{A} \models (\forall z(z \equiv z)) ¡Definition; — \mathfrak{A} \models (\forall z(z \equiv z)) and not \mathfrak{A} \models (\forall z(z \equiv z))
    - CONTR
  -\mathfrak{A}
ot\models ((\forall z(z\equiv z))\wedge \neg(\forall z(z\equiv z)))
    - A | | ⊥
```

3.2.4 (Metatheorem) Unsatisfiable equivalence

```
- \Sigma \vDash \stackrel{\leftarrow}{\bot} iff for any \mathfrak{A}, \mathfrak{A} \not\vDash \Sigma

- Proof:

- \Sigma \vDash \stackrel{\leftarrow}{\bot} iff

— For any \mathfrak{A}, \mathfrak{A} \not\vDash \Sigma iff

— For any \mathfrak{A}, if \mathfrak{A} \vDash \Sigma, then \mathfrak{A} \vDash \stackrel{\leftarrow}{\bot} iff

— For any \mathfrak{A}, no \mathfrak{A} \vDash \Sigma or \mathfrak{A} \vDash \stackrel{\leftarrow}{\bot} iff

— For any \mathfrak{A}, \mathfrak{A} \not\vDash \Sigma

- \Sigma \not\vDash \stackrel{\leftarrow}{\bot} iff there exists \mathfrak{A}, \mathfrak{A} \vDash \Sigma
```

3.2.5 (Metatheorem) Completeness of First-order Logic: Proof lemma schema

```
- Prove: (I) If UC(\Sigma) \not\vdash \stackrel{\longleftarrow}{\perp}, then there exists \mathfrak{A}, \mathfrak{A} \models UC(\Sigma)
- Corollaries: \Sigma \vDash \phi, then \Sigma \vdash \phi
- If UC(\Sigma) \not\vdash \bot,
— There exists \mathfrak{A}, \mathfrak{A} \models UC(\Sigma) and \mathfrak{A} \not\models \mathcal{I}
¡Contradiction has no model; — Not for any \mathfrak{A}, if \mathfrak{A} \models UC(\Sigma), then \mathfrak{A} \models \overline{\bot}
¡Definition; — UC(\Sigma) \not\vDash \bot
¡Definition; – If UC(\Sigma) \not\vdash \stackrel{\leftarrow}{\perp}, then UC(\Sigma) \not\vdash \stackrel{\leftarrow}{\perp}

- Proof: TODO ABSTRACTED

Chapter 4

Incompleteness From Two Points of View

4.1 Introduction

- \mathcal{L} is cool and all, but how about \mathcal{L}_{NT} and \mathfrak{N} ?
- Can we find some way for any $\phi \in Form(\mathcal{L}_{NT})$, if $\mathfrak{N} \models \phi$, then $\Sigma \vdash \phi$ (complete) such that Σ is consistent and decidable?

4.1.1 (Definition) Axiomatic completeness

- Σ is axiomatically complete iff for any $\sigma \in Form(\mathcal{L}), \ \Sigma \vdash \sigma \text{ or } \Sigma \vdash \neg \sigma$

4.1.2 (Definition) Axiomatization

- Σ is an axiomatization of $Th(\mathfrak{A})$ iff for any $\sigma \in Th(\mathfrak{A})$, $\Sigma \vdash \sigma$
- Promise: Given any complete, consistent, and decidable axiomatization for \mathfrak{N} (Σ), we are going to find a sentence σ such that $\mathfrak{N} \vDash \sigma$ but $\Sigma \not\vdash \sigma$

4.2 Complexity of Formulas

- We will find this Godel sentence via complexity of formulas

4.2.1 (Definition) Bounded quantifiers

- If occurs(x, t), then the following are bounded quantifiers:
- $-(\forall x \leq t)\phi :\equiv \forall x(x \leq t \implies t)$
- $(\exists x \le t)\phi :\equiv \exists x (x \le t \land t)$

4.2.2 (Definition) Sigma-formulas

- 1.2.2 (Delimition) Signa formatas
- Σ_{Form} is defined as the smallest set of \mathcal{L}_{NT} formulas that contains: Atomic formulas
- If $\alpha \in \Sigma_{Form}$, then $\neg \alpha \in \Sigma_{Form}$
- If $\{\alpha, \beta\} \subseteq \Sigma_{Form}$, then $\{\alpha \vee \beta, \alpha \wedge \beta\} \subseteq \Sigma_{Form}$
- If $\alpha \in \Sigma_{Form}$ and occurs(x,t), then $\{(\forall x < t)\alpha, (\exists x < t)\alpha\} \subseteq \Sigma_{Form}$
- If $\alpha \in \Sigma_{Form}$ and $x \in Var$, then $\exists x \alpha \in \Sigma_{Form}$
- There are closed under bounded quantification + unbounded existential quantification
- These are not complicated enough to establish incompleteness

(Definition) Pi-formulas 4.2.3

- Π_{Form} is defined as the smallest set of \mathcal{L}_{NT} formulas that contains:
- Atomic formulas
- If $\alpha \in \Sigma_{Form}$, then $\neg \alpha \in \Sigma_{Form}$
- If $\{\alpha, \beta\} \subseteq \Sigma_{Form}$, then $\{\alpha \vee \beta, \alpha \wedge \beta\} \subseteq \Sigma_{Form}$
- If $\alpha \in \Sigma_{Form}$ and occurs(x,t), then $\{(\forall x < t)\alpha, (\exists x < t)\alpha\} \subseteq \Sigma_{Form}$
- If $\alpha \in \Sigma_{Form}$ and $x \in Var$, then $\forall x \alpha \in \Sigma_{Form}$
- There are closed under bounded quantification + unbounded universal quantification
- These are complicated enough to establish incompleteness

4.2.4 (Definition) Delta-formulas

- $\Delta_{Form} = \Sigma_{Form} \cap \Pi_{Form}$

TODO: REMARKS, EXERCISES

4.3 The Roadmap to Incompleteness

- Key idea: use numbers to encode deductions, then construct a self-reference paradoxical deduction
- It is easy to encode, decode, validate numbers into deductions and vice versa
- Promise: fix our coding scheme, prove that the coding is nice, use the coding scheme in order to construct the formula σ , and then prove that σ is both true and not provable

An Alternate Route 4.4

- Instead of looking at formulas and deductions, we can look at computations
- In this route, we will still encode computations are numbers

4.5 How to Code a Sequence of Numbers

- We will use prime numbers with non-zero exponents

Prime number function 4.5.1

- The function $p: \mathbb{N} \to \mathbb{N}$ is defined as p(k) is the kth prime number
- $-p(0) = 1, p(1) = 2, p(2) = 3, p(3) = 4, ..., p_i = p(i)$

4.5.2 Set of finite sequences of natural numbers

- The set $\mathbb{N}^{\leq \mathbb{N}}$ is the set of all finite sequences of natural numbers

4.5.3**Encoding function**

- The encoding function $enc: \mathbb{N}^{<\mathbb{N}} \to \mathbb{N}$ is defined as:
- If k > 0, then $enc(\overline{a_i}) = \prod_{i=1}^k (p_i^{a_i+1})$
- Otherwise, then enc() = 1

4.5.4 Code numbers

- The set code numbers C is defined as $C = \{enc(s) : s \in \mathbb{N}^{\leq \mathbb{N}}\}\$
- This is easy to check

4.5.5 Decoding function

- The decoding function $dec: \mathbb{N} \to \mathbb{N}^{<\mathbb{N}}$ is defined as:
- If $a \in C$, then
- There exists $\underbrace{a_i}_{i=1}$, $a = enc(\underbrace{a_i}_{i=1})$

; Fundamental theorem of arithmetic + Definition; — $dec(a) = \left\langle \begin{bmatrix} k \\ a_i \end{bmatrix} \right\rangle$

– Otherwise, then $dec(a) = \langle \rangle$

4.5.6 Length function

- The length function $len : \mathbb{N} \to \mathbb{N}$ is defined as:
- $-\operatorname{If} a \in C$, then
- There exists $\begin{bmatrix} a_i \\ i-1 \end{bmatrix}$, $a = enc(\begin{bmatrix} k \\ a_i \end{bmatrix})$

; Fundamental theorem of arithmetic + Definition; — len(a) = k

- Otherwise, then len(a) = 0
- The Fundamental theorem of arithmetic ensures that for any positive integer, there exists is a unique prime factorization

4.5.7 Index function

- The index function $idx: \mathbb{N}^2 \to \mathbb{N}$ is defined as:
- If $a \in C$, then
- There exists $\begin{bmatrix} k \\ a_i \end{bmatrix}$, $a = enc(\underbrace{\begin{bmatrix} k \\ a_i \end{bmatrix}}_{i=1})$

¡Fundamental theorem of arithmetic + Definition; — If $1 \le i \le k$, then $idx(a,i) = a_i$

- Otherwise, idx(a,i) = 0
- Otherwise, then idx(a, i) = 0

4.5.8 Concatenate function

- The concatenate function $cat: \mathbb{N}^2 \to \mathbb{N}$ is defined as:
- If $a \in C$ and $b \in C$, then
- There exists $\underbrace{\begin{bmatrix} a_i \\ i=1 \end{bmatrix}}_{i=1}$, $a = enc(\underbrace{\begin{bmatrix} a_i \\ a_i \end{bmatrix}}_{i=1})$

¡Fundamental theorem of arithmetic + Definition¿. — There exists b_i , $b = enc(b_i)$, $b = enc(b_i)$

; Fundamental theorem of arithmetic + Definition; — $cat(a,b) = enc(\underbrace{a_i}_{i=1}), \underbrace{b_i}_{i=1})$

– Otherwise, then cat(a, b) = 0

4.6 An Old Friend

- N is strong enough to prove every true sentence in Σ_{Form} , but it is not strong enough to prove every true sentence in Π_{Form}
- Proof: TODO ABSTRACTED

4.6.1 (Definition) Goden numbering function

- If $s \in Form(\mathcal{L}_{NT})$ and $s :\equiv \neg \alpha$, then $GN(s) = enc(1, GN(\alpha))$

- $GN: String(\mathcal{L}_{NT}) \to \mathbb{N}$ is defined as:

```
- If s \in Form(\mathcal{L}_{NT}) and s :\equiv \alpha \vee \beta, then GN(s) = enc(3, GN(\alpha), GN(\beta))

- If s \in Form(\mathcal{L}_{NT}) and s :\equiv \forall v_i \alpha, then GN(s) = enc(5, GN(v_i), GN(\alpha))

- If s \in Form(\mathcal{L}_{NT}) and s :\equiv t_1 t_2, then GN(s) = enc(7, GN(t_1), GN(t_2))

- If s \in Form(\mathcal{L}_{NT}) and s :\equiv < t_1 t_2, then GN(s) = enc(19, GN(t_1), GN(t_2))

- If s \in Term(\mathcal{L}_{NT}) and s :\equiv s(t), then GN(s) = enc(11, GN(t))

- If s \in Term(\mathcal{L}_{NT}) and s :\equiv t_1 t_2, then GN(s) = enc(13, GN(t_1), GN(t_2))

- If s \in Term(\mathcal{L}_{NT}) and s :\equiv t_1 t_2, then GN(s) = enc(15, GN(t_1), GN(t_2))

- If s \in Term(\mathcal{L}_{NT}) and s :\equiv t_1 t_2, then GN(s) = enc(17, GN(t_1), GN(t_2))

- If s \in Var(\mathcal{L}_{NT}) and s :\equiv v_i, then GN(s) = enc(2i)

- If s \in Const(\mathcal{L}_{NT}) and s :\equiv 0, then GN(s) = enc(9)

- Otherwise, GN(s) = 3
```

Chapter 5

Computability Theory

5.1The Origin of Computability Theory

- Computability theory formalizes the notion of algorithms and computations
- The goal is to create formal models of computation and study its limitations
- Several models of note: Herbrand-Godel equations, Church's lambda-calculus, Kleene recursion, Turing machines
- It's easy to see that if a function is computable in these models, then it is computable in the real-world, but the converse is not so clear
- Turing machines model computation similar to how we do computations in the real-world, so maybe the converse holds (Church-Turing thesis)

- All models mentioned induce the same class of computable functions

The Basics 5.2

- We will use Kleene recursion because it is easy to use in proofs

5.2.1(Definition) Computable functions

- The set of computable functions μ is defined by:
- Zero function: If $\mathcal{O}: \emptyset \to \{0\}$ and O() = 0, then $O \in \mu$
- Successor function: If $S: \mathbb{N} \to \mathbb{N}$ and S(x) = x + 1, then $S \in \mu$
- Projection function: If $1 \leq i \leq n$ and $\mathcal{I}_i^n : \mathbb{N}^n \to \mathbb{N}$ and $\mathcal{I}_i^n(\underbrace{x_j}_{i-1}) = x_i$, then $\mathcal{I}_i^n \in \mu$
- Composition: If $h: \mathbb{N}^m \to \mathbb{N}$ and for any $i \in \left\{ \begin{array}{c} n \\ j \\ i-1 \end{array} \right\}$, $g_i: \overline{\mathbb{N}^n \to \mathbb{N}}$ and $\left\{ h, \overline{\begin{bmatrix} g_i \\ g_i \end{bmatrix}} \right\} \subseteq \mu$ and $f: \mathbb{N}^n \to \mathbb{N}$ and

$$f(\underbrace{x_j}_{j=1}^n) = h(\underbrace{g_i(\underbrace{x_j}_{j=1}^n)}_{j=1}), \text{ then } f \in \mu$$

- Primitive recursion: If $g: \mathbb{N}^n \to \mathbb{N}$ and $h: \mathbb{N}^{n+2} \to \mathbb{N}$ and $\{g,h\} \subseteq \mu$ and $f: \mathbb{N}^{n+1} \to \mathbb{N}$ and $f(\underbrace{x_i}_{i=1}^n, 0) = g(\underbrace{x_i}_{i=1}^n)$ and

$$f(\underbrace{x_i}_{i=1}^n, y+1) = h(\underbrace{x_i}_{i=1}^n, y, f(\underbrace{x_i}_{i=1}^n, y)), \text{ then } f \in \mu$$

- Minimalization: If $(g: \mathbb{N}^{n+1} \to \mathbb{N} \text{ and } g \in \mu \text{ and } \mu_{UBS}(g): \mathbb{N}^n \to \mathbb{N} \text{ and if (there exists } z, g(\underbrace{x_i}_{i=1}, z) = 0 \text{ and for any } 1$

$$z_- < z$$
, $g(\underbrace{x_i}_{i=1}, z_-) \neq 0$), then $\mu_{US}(g)(\underbrace{x_i}_{i=1}) = z$), then $\mu_{US} \in \mu_{US}$

- Projection and composition can simulate arbitrary function arities
- Minimalization is also called unbounded search and it can possibly be undefined which introduces partial functions

50

- Partial functions are important in computability theory
- When we claim that an algorithm computes a partial function $f: \mathbb{N}^n \to \mathbb{N}$, we claim that $f(\overline{x_i})$ is defined iff the algorithm terminates on the inputs and returns the correct output

5.2.2(Definition) Primitive recursive functions

- The set of primitive recursive PR is defined by the definition of computable functions without Minimalization

5.2.3(Definition) Characteristic function

- The characteristic function $\chi_{A(\square)}: \mathbb{N}^n \to \{0,1\}$ for $A \subseteq \mathbb{N}^n$ and n > 1 is defined as:

(Definition) Computable set/relation 5.2.4

- The set/relation A is computable iff its characteristic function $\chi_{A(\square)}$ is computable
- The set/relation A is primitive recursive iff its characteristic function $\chi_{A(\square)}$ is recursive

5.2.5 (Metatheorem) Constant function is primitive recursive

- The constant function $c_i^n(\overbrace{x_j}) = i$ is primitive recursive j=1
- Proof:

$$-c_0^n(\underbrace{x_j}_{j=1}^n) = 0 = \mathcal{O}()$$

¡Zero function; — $c_0^n \in PR$

¡Composition; – If i > 0 and $c_i^n \in PR$, then

¡Successor function; — $c_{i+1}^n(\underbrace{\begin{bmatrix} n \\ x_j \end{bmatrix}}_{j=1}) = S(c_i^n(\underbrace{\begin{bmatrix} n \\ x_j \end{bmatrix}}_{j=1}))$

$$-c_{i+1}^n(\underbrace{x_j}_{i=1}^n) \in PR$$

¡Composition;
$$-c_i^n \in PR$$
¡Induction; $-c_i^n \left(\underbrace{x_i}_{n} \right) = i$

Definition: The approach is not a construction via primitive recursion because i is not treated as a function argument

5.2.6(Metatheorem) Standard addition, multiplication, exponentiaion are primitive recur-

- The functions $+, \cdot, E$ from the standard number theory (\mathcal{N}) are primitive recursive
- $-+\in PR$
- Proof:
- $-I_1^1(x) = x$
- $-I_1^1 \in PR$

¡Projection function; $-S \in PR$

¡Successor function; $-S_1^3(x, y, z) = S(I_1^3(x, y, z))$

5.2. THE BASICS 51

```
-S_1^3 \in PR
¡Composition; -+(x,0) = I_1^1(x)
-+(x,y+1) = S_1^3(x,y,+(x,y))
-+ \in PR
Primitive recursion; - \cdot \in PR
- Proof:
-c_0^1(x)=0
pointion : -c_0^1 \in PR
; Constant function is primitive recursive; -+ \in PR
Standard addition, multiplication, exponential are primitive recursive, -+\frac{3}{1}(x,y,z) = +(I_1^3(x,y,z),I_3^3(x,y,z))
-+\frac{3}{1} \in PR
Composition: - \cdot (x,0) = c_0^1(x)
-\mathbf{L}(x,y+1) = +\frac{3}{1}(x,y,\mathbf{L}(x,y))
- \mathbf{I} \in PR
¡Primitive recursion; - E \in PR
- Proof:
-c_1^1(x)=1
¡Definition; -c_1^1 \in PR
¡Constant function is primitive recursive; - \cdot \in PR
- \mathbf{1}^3 \in PR
[Composition]. -E(x,0) = c_1^1(x)
-E(x,y+1) = \frac{3}{1}(x,y,E(x,y))
-E \in PR
Primitive recursion; ========
```

5.2.7 (Metatheorem) Modified subtraction is primitive recursive

- The modified subtraction function $\dot{-}$ is defined as:

- If y > x, then x - y = 0- If $y \not> x$, then x - y = x - y

5.2.8 (Metatheorem) Standard logic connectives are closed under the primitive recursion

```
- The relations \neg, \lor from the standard propositional logic (\mathcal{PL}) are closed under primitive recursion - For any \{\chi_{U(\square)}, \chi_{V(\square)}\} \subseteq PR, \{\chi_{\neg U(\square)}, \chi_{U(\square) \lor V(\square)}\} \subseteq PR - Proof:

- For any \chi_{U(\square)} \in PR, -\dot{-} \in PR [Modified subtraction is primitive recursive; -Conj(x) = \dot{-}(c_1^1(x), I_1^1(x)) -Conj \in PR [Composition; -\chi_{\neg U(\square)}(\begin{bmatrix} x_i \\ x_i \end{bmatrix}) = Conj(\chi_{U(\square)}(\begin{bmatrix} x_i \\ x_i \end{bmatrix})) -\chi_{\neg U(\square)} \in PR - For any \{\chi_{U(\square)}, \chi_{V(\square)}\} \subseteq PR, -\bullet \in PR

- Proof: all functions used are in PR or closed under PR

5.2.19(Metatheorem) SingleDec, length, isCodeFor functions are primitive recursive

- For any $\left\langle \begin{bmatrix} a_i \\ a_i \end{bmatrix} \right\rangle$, there exists $a \in \mathbb{N}$, there are the following primitive recursive functions:
- -len(a) = n
- $-singleDec_i(a) = a_i$

¡Misc. theorems; ===

- $-\{len, singleDec_j\} \subseteq PR$
- $isCodeFor(a, \overline{a_i})$ iff len(a) = n and for any $1 \le j \le n$, $singleDec_j(a) = a_j$ and $\chi_{isCodeFor} \in PR$
- Proof: all utilized functions and relations of prime numbers are in PR or closed under PR

5.2.20(Metatheorem) IsCode, empty, singleEnc, concatenate functions are primitive recursive

- isCode(a) iff there exists $\left\langle \begin{bmatrix} len(a) \\ a_i \end{bmatrix} \right\rangle$, $isCodeFor(a, \left\langle \begin{bmatrix} len(a) \\ a_i \end{bmatrix} \right\rangle)$ and $\chi_{isCode} \in PR$
- -len(empty()) = 0 and $empty \in PR$
- If len(a)=1, then there $singleEnc(a)=p(1)E(singleDec_1(a)+1)$ and $singleEnc\in PR$
- If $isCodeFor(a, \begin{bmatrix} n \\ a_i \end{bmatrix})$ and $isCodeFor(b, \begin{bmatrix} b_j \\ j=1 \end{bmatrix})$, then $isCodeFor(cat(a, b), \begin{bmatrix} n \\ a_i \end{bmatrix}, \begin{bmatrix} b_j \\ j=1 \end{bmatrix})$ and $cat \in PR$
- Proof: all utilized functions and relations of prime numbers are in PR or closed under PR

¡Misc. theorems; =====

5.2. THE BASICS 55

5.2.21 (Metatheorem) Enc, dec are primitive recursive

-
$$enc(\underbrace{\begin{bmatrix} x_i \\ x_i \end{bmatrix}}) = cat(\underbrace{\begin{bmatrix} singleEnc(x_i) \\ i=1 \end{bmatrix}})$$
 and $enc \in PR$
- $dec(x) = \left\langle \underbrace{\begin{bmatrix} singleDec_i(x) \\ \end{bmatrix}}\right\rangle$ and $dec \in PR$

- Alternative definitions could be formed using bounded products and the prime number function
- Proof: all utilized functions and relations of prime numbers are in PR or closed under PR

5.2.22 (Metatheorem) Coding is monotonic

- For any
$$\binom{n}{a_i}$$
, for any $1 \le m \le n$, $enc(\frac{n}{a_i}) < enc(\frac{m-1}{a_h}, a_m + 1, \frac{n}{a_t})$
- For any $\binom{n+1}{a_i}$, $enc(\frac{n}{a_i}) < enc(\frac{n+1}{a_i})$

- These monotonicity properties guarantee that:
- All the numbers in the sequence encoded by the number x will be smaller than x
- The code for a subsequence of a sequence will be smaller than the code for the sequence itself
- This makes it easy to find primitive recursive definitions of predicates and functions dealing with encoded sequences
- Proof: TODO ABSTRACTED

5.2.23 (Metatheorem) Subbed Godel numbering function is the primitive recursive

```
- If \phi \in Form(\mathcal{L}_{NT}) and free(x,\phi), then there exists f_{\phi}(a) = GN(|\phi|_{\overleftarrow{a}}^x) and f_{\phi} \in PR

- The halting predicate H is defined as H(y,x) iff u(y,x) is defined
- $-\chi_H \not\in \mu$
- Proof:
- If $\chi_H \in \mu$, then
- If $\chi_H(x,x) = 0$, then $d'(x) = \{x\}^1(x) + 1$ and otherwise, d'(x) = 0
- $-d' \in \mu$

Definition by cases are closed under primitive recursion; — $d' \notin \mu$

¡Total diagonal functions are non-computable; — CONTRADICTION !! – $\chi_H \notin \mu$

¡Metaproof by contradiction; ===========

5.2.46 (Metatheorem) S-m-n theorem

- There exists $S_n^m \in PR$, $\{S_n^m(e, \underbrace{x_i}_{i=1})\}^m(\underbrace{y_j}_{j=1}) = \{e\}^{n+m}(\underbrace{x_i}_{i=1}, \underbrace{y_j}_{j=1})$
- TODO Something about the combination of two functions

- Proof: TODO ABSTRACTED

5.3 (Notation) Computability notations

5.3.1 (Definition) Semi-computable set

- The set A is semi-computable $(A \in SC)$ iff there exists $f \in \mu$, A = dom(f)
- There exists an algorithm that confirms membership, but not necessarily decide membership

5.3.2 (Definition) Computably enumerable set

- The set A is computable enumerable $(A \in CE)$ iff there exists $f \in \mu$, Total(f) and A = rng(f)
- Alternative definition: $A \in CE$ iff Finite(A) or there exists $f \in \mu$, Bijection(f) and Total(f) and A = rng(f)
- There exists an algorithm that can list down all the elements of the set

5.3.3 (Metatheorem) Equivalent definition for domain

```
- If f \in \mu and CI(e, f), then dom(f) = \{x : (\text{ there exists } t), (\mathcal{T}(e, x, t))\} - Proof: 
¡Kleene's Normal Form theorem; – If x \in dom(f), then — There exists y \in \mathbb{N}, f(x) = y ¡Definition; — There exists \Gamma \in \mathcal{C}, \Gamma = \Omega \cup \langle enc(e, enc(x), y) \rangle ¡Computation iff computable indexable corollary; — t = enc(\underbrace{\omega_i}_{i=1}, enc(e, enc(x), y)) ¡IsComputation is primitive recursive; — There exists t, \mathcal{T}(e, enc(x), t) ¡T-predicate is primitive recursive; — dom(f) \subseteq \{x : (\text{ there exists } t), (\mathcal{T}(e, x, t))\} — If x \in \{x : (\text{ there exists } t), (\mathcal{T}(e, x, t))\}, then — f(\underbrace{x_i}_{i=1}) = \mathcal{U}(t) = y ¡Kleene's Normal Form theorem; — There exists y \in \mathbb{N}, f(x) = y — x \in dom(f) ¡Definition; — \{x : (\text{ there exists } t), (\mathcal{T}(e, x, t))\} \subseteq dom(f) — dom(f) = \{x : (\text{ there exists } t), (\mathcal{T}(e, x, t))\}
```

5.3.4 (Metatheorem) Computable sets are semi-computable

```
- If \chi_A \in \mu, then A \in SC

- Proof:

- If \chi_A \in \mu, then

- f(x) = \mu_{US}(\chi_{x \in A \land (\square = \square)})(x)

- f \in \mu

¡Misc. theorems; — dom(f) = A

— There exists f \in \mu, A = dom(f)

— A \in SC
```

5.3.5 (Metatheorem) SC iff CE property

```
- If A \subseteq \mathbb{N}, then
-A \in SC iff
\overline{A} = \{\} or there exists f \in PR, rng(f) = \overline{A} iff
-A \in CE

iDisjunction_{i} — Total(inFind)
i(I); — There exists \chi, if f_0(inFind(x)) = x, then \chi(x) = 0, and otherwise \chi(x) = 1
¡Misc. theorems; -- \chi_A(x) = \chi(x) = 0 iff x \in A
\overline{\phantom{A}} \chi_A \in \mu
-\chi_A \in \mu
[Conjunction]. – If A \in CE and \bar{A} \in CE, then \chi_A \in \mu
¡Abbreviate; -\chi_A \in \mu iff A \in CE and \bar{A} \in CE
[Conjunction]. The case A = \{\} is required because a function can't be total if rng(f) = \{\}
```

5.3.8 (Metatheorem) Computable iff SC property

```
- \chi_A \in \mu iff A \in SC and \bar{A} \in SC

- Proof:

- A \in SC and \bar{A} \in SC iff A \in CE and \bar{A} \in CE

¡SC iff CE property; - A \in CE and \bar{A} \in CE iff \chi_A \in \mu

¡Computable iff CE property; - \chi_A \in \mu iff A \in SC and \bar{A} \in SC
```

5.3.9(Definition) Semi-computable set by index

- The e-th semi-computable set W_e is defined as $W_e = dom(\{e\})$

5.3.10(Metatheorem) SC iff SC indexed

```
- A \in SC iff there exists e, A = \mathcal{W}_e
- Proof:
```

 $-A \in SC$ iff

- There exists $f \in \mu$, A = dom(f) iff

Definition: — There exists e, $A = dom(\{e\})$ iff

Enumeration theorem; — There exists $e, A = \mathcal{W}_e$ iff

5.3.11(Definition) K

```
- The set \mathcal{K} is defined as \mathcal{K} = \{x : x \in \mathcal{W}_x\}
```

- K stands for kool

5.3.12(Metatheorem) N-complement of K is not semi-computable

```
-\bar{\mathcal{K}} \not\in SC
```

- Proof:

- If $\bar{\mathcal{K}} \in SC$, then

— There exists $m, \mathcal{K} = \mathcal{W}_m$ i(I).

 $SC \text{ iff } SC \text{ indexed} : -m \in \overline{\mathcal{K}} \text{ iff } m \in \mathcal{W}_m$

 $\mathsf{j}(\mathsf{I})\mathsf{j} - m \in \mathcal{W}_m \text{ iff } m \in \mathcal{K}$

¡Definition; — $m \in \mathcal{K}$ iff $m \notin \bar{\mathcal{K}}$

¡Definition; — $m \in \bar{\mathcal{K}}$ iff $m \notin \bar{\mathcal{K}}$

¡Conjunction; — CONTRADICTION !! $-\bar{\mathcal{K}} \in SC$

¡Metaproof by contradiction; =========

(Metatheorem) K is semi-computable 5.3.13

```
- \mathcal{K} \in SC
```

- Proof:

 $-x \in \mathcal{K}$ iff

 $-x \in \mathcal{W}_x$ iff

¡Definition; — $x \in dom(\{x\})$ iff ¡Definition; — There exists t, $\mathcal{T}(x, x, t)$

¡Equivalent definition for domain; $-x \in \mathcal{K}$ iff there exists $t, \mathcal{T}(x, x, t)$ ¡(I);

¡Abbreviate; – There exists $f, f(x) = \mu_{US}(\chi_{\mathcal{T}(x,x,\square)})(x,x)$

 $-f \in \mu$

¡Misc. theorems; $-dom(f) = \mathcal{K}$

 $i(I)i - K \in SC$

5.3.14 (Metatheorem) K is not computable

```
-\chi_{\mathcal{K}} \not\in \mu
```

- Proof:

 $-\operatorname{If} \chi_{\mathcal{K}} \in \mu$, then

 $-\mathcal{K} \in SC \text{ and } \bar{\mathcal{K}} \in SC$

¡Computable iff SC property; $-\bar{\mathcal{K}} \notin SC$

¡N-complement of K is not semi-computable; $-\bar{\mathcal{K}} \in SC$ and $\bar{\mathcal{K}} \notin SC$

¡Conjunction; — CONTRADICTION!!

 $-\chi_{\mathcal{K}} \not\in \mu$

5.3.15 (Metatheorem) SC subset of N-complement of K contains a nonSC element

5.3.16 (Metatheorem) Sigma formulas can emulate computable functions

- For any
$$f \in \mu$$
, there exists $\phi(\frac{Arity(f)}{|x_i|}, y) \in \Sigma_{Form}$, $f(\frac{arity(f)}{|a_i|}) = b$ iff $\mathfrak{N} \models |\phi|_{Arity(f)}^{Arity(f)}$ if TODO CLEANUP? - Proof:

thm:conjunction:conju

5.3.26 (Remarks) Incompleteness theorem intuition

- From an intuitive computability-theoretic point of view, the first Incompleteness Theorem is an inevitable consequence of the fact that we can define an undecidable set in the \mathcal{L}_{NT} -structure \mathfrak{N} . In other words, there exists $\phi(x) \in \mathcal{L}_{NT}$, $\mathfrak{N} \models |\phi|_{\overline{a}}^x$ iff $a \in \mathcal{K}$.
- Since we can define an undecidable set in \mathfrak{N} , no semi-decidable set of axioms of \mathcal{L}_{NT} will be complete for \mathfrak{N} .
- If there were such a set of axioms, we could decide membership in an undecidable set. Otherwise, we could decide if a is a member of \mathcal{K} by enumerating deductions until we encountered a proof or a refutation of $|\phi|^x_{\frac{1}{\alpha}}$.
- The expressive power (the standard interpretation) of the language \mathcal{L}_{NT} is essential. To define an undecidable set like \mathcal{K} , we need an expressive language.
